We interviewed Professor Richard B. van Breemen who is studying medicinal properties of natural products at the University of Illinois, College of Pharmacy, in Chicago, using advanced mass spectrometry. Recently he found that lycopene (the red carotenoid in tomatoes) could reduce risk of prostate cancer. Shimadzu has been supporting Prof. van Breemen's laboratory for six years, by providing Shimadzu's state-of-the-art mass spectrometry such as IT-TOF, LCMS-8040 and LCMS-8050.

**Professor Richard B. van Breemen, University of Illinois, Chicago, USA**

We interviewed Professor Richard B. van Breemen who is studying medicinal properties of natural products at the University of Illinois, College of Pharmacy, in Chicago, using advanced mass spectrometry. Recently he found that lycopene (the red carotenoid in tomatoes) could reduce risk of prostate cancer. Shimadzu has been supporting Prof. van Breemen's laboratory for six years, by providing Shimadzu's state-of-the-art mass spectrometry such as IT-TOF, LCMS-8040 and LCMS-8050.

**Shimadzu:**
First, could you outline your research and achievements?

**Prof. van Breemen:**
My research group investigates natural cancer chemoprevention agents and the safety and efficacy of botanical dietary supplements. We specialize in mass spectrometric studies of natural products that span the range from discovery to clinical investigation. An early proponent of MS-based screening, we use our ultrafiltration-mass spectrometry approach to find pharmacologically active compounds in complex natural product extracts. Then, we use high resolution LC-MS/MS to investigate the metabolism of lead compounds. Finally in support of clinical trials, we use quantitative UHPLC-MS-MS to measure levels of the active natural products and their metabolites as well as biomarkers of efficacy in clinical specimens.

Some of our most successful projects have included studies of carotenoid bioavailability and chemoprevention that are exemplified by our clinical trials of prostate cancer chemoprevention by the tomato carotenoid lycopene. As I am director of the oldest academic center in the United States focused on the safety and efficacy of botanical dietary supplements (UCICNH Center for Botanical Dietary Supplements Research), we help to safeguard women’s health by investigating mechanisms of action and safety of botanicals used by menopausal women as alternatives to conventional estrogen replacement therapy. Qualitative and quantitative applications of mass spectrometry are essential at every stage of these botanical dietary supplement studies.

**Shimadzu:**
Why are you interested in those fields?

**Prof. van Breemen:**
Our interest in natural products as sources of new drugs is based on the fact that at least half of all existing pharmaceuticals are natural products or are derived from them, which should be no surprise as Nature has already preselected these substances for bioactivity. Now that most major pharmaceutical companies have abandoned their natural products drug discovery programs, our search for new natural pharmaceutical agents has become even more imperative. Since the Women’s Health Initiative indicated that conventional estrogen replacement therapy might result in its accumulation in lakes and rivers where it might affect aquatic wildlife due to its endocrine disruption activity. There is particular concern that exposure of children to endocrine disrupting chemicals like BPA might be especially significant.

**Shimadzu:**
How are our instruments helping you?

**Prof. van Breemen:**
My research group has witnessed many innovations in mass spectrometry and chromatography over the last 25+ years that include the introduction of novel ionization techniques such as MALDI and electrospray, the invention of new tandem mass spectrometers such as MALDI TQ-F and IT-TOF instruments, and the introduction of UHPLC. All of these innovations contribute to our research by enabling faster MS-based screening of botanical and marine extracts, faster structural characterization of natural product lead compounds and faster and more sensitive quantitative analysis in support of preclinical and clinical studies.

**Shimadzu:**
What are Shimadzu’s strengths compared to other companies?

**Prof. van Breemen:**
For many years, Shimadzu has been a leader in HPLC and UHPLC by providing highly reliable as well as high performance chromatography instrumentation. Shimadzu is also highly regarded for providing high quality service support. In the field of MALDI TQ-F and IT-TOF, Shimadzu offers the highest performance and features not available from most vendors due to innovations such implementation of the late Prof. Robert Cotter’s curved-field reflection and high-energy CID features, which facilitate structural studies using charge-remote fragmentation. Shimadzu’s high resolution IT-TOF mass spectrometer offers MS capabilities not obtainable with QqTOF instruments, and Shimadzu continues to lead the world in fast triple quadrupole mass spectrometer technology with the LCMS-8030, LCMS-8040 and now the fastest scanning and most sensitive of all, the LCMS-8050.

**Shimadzu:**
Thank you very much.

**Prof. van Breemen:**
Like most academic biomedical mass spectrometry laboratories, we continue to increase and thereby enable us to be more productive and effective. In response, our Botanical Center is working to ensure the quality service support. In the field of MALDI TOF/TOF, Shimadzu offers the highest performance and features not available from most vendors due to innovations such implementation of the late Prof. Robert Cotter’s curved-field reflection and high-energy CID features, which facilitate structural studies using charge-remote fragmentation. Shimadzu’s high resolution IT-TOF mass spectrometer offers MS capabilities not obtainable with QqTOF instruments, and Shimadzu continues to lead the world in fast triple quadrupole mass spectrometer technology with the LCMS-8030, LCMS-8040 and now the fastest scanning and most sensitive of all, the LCMS-8050.

**Shimadzu:**
Finally, can you please share any requests that you have with respect to what your users might want to see more of from Shimadzu?

**Prof. van Breemen:**
Fortunately, the performance specifications of mass spectrometers are always pushing the limits of technology in terms of speed and sensitivity in the analysis of clinical and research specimens. I love Shimadzu’s new scanning and most sensitive of all, the LCMS-8050.

Shimadzu:
Finally, can you please share any requests that you have with respect to analytical instrument vendors?

Prof. van Breemen:
Like most academic biomedical mass spectrometry laboratories, we are always pushing the limits of technology in terms of speed and sensitivity in the analysis of clinical and research specimens. Fortunately, the performance specifications of mass spectrometers continue to increase and thereby enable us to be more productive than ever. For example, we are looking forward to seeing how much more research we can accomplish each day using Shimadzu’s new LCMS-8050 triple quadrupole mass spectrometer.

Shimadzu:
Thank you very much.
